

ORBIS

Social App

A Location-Driven Social Ecosystem · Product, Flow & Architecture KT

The Problem We Solve

Why existing apps fall short

Current Apps

Generic feeds show irrelevant global content
You can't find who hangs out at a specific café
Communities are virtual, not real-world anchored
No map context for social discovery

Orbis Vision

Hyper-local feeds tied to real places
See exactly who's active at your favourite spots
Communities have GPS borders on a live map
Every post is anchored to a physical location

Product Overview

What is Orbis Social?

Location (GPS)

Real-world coordinates power every feature

Tribe (Community)

Groups of people sharing interests & geography

Place (POI)

Real-world Points of Interest on a live map

GPS + Community + Real Places = Orbis Tribe (the Core Unit)

The Core Concept: Tribe as Territory

The magic that makes Orbis unique

Tribe = Community + Territory

A tribe isn't just a chat room — it has GPS borders.

Places = Power

Claiming a real place expands your tribe's visible territory on the map.

Territory = Visibility

The more places you claim, the bigger your tribe appears to everyone browsing.

The 5 Core Entities

The building blocks of Orbis — know these, know the app

Tribe

A community group with a defined map region. The most important entity.

Place

A real-world Point of Interest (POI) pinned on the map by a user.

Claim

The ownership link binding a User or Tribe to a Place.

Media

Photos/videos posted by users, always tied to a Place and Tribe.

User

The actor who joins Tribes, creates Places, and posts content.

Entity Relationships

User → joins → Tribe

User → creates → Place

Tribe → claims → Place

User/Tribe → Claim → Place

User → posts → Media @ Place

Media → appears in → Tribe Feed

Deep Dive: Place & Claim

How ownership of real-world locations works

1. Unclaimed Place

Any user adds a café/park to the map.
It's grey — no tribe owns it.

2. Claim Initiated

User taps 'Claim for my Tribe'. A Claim
record is created in the database linking
Tribe ↔ Place.

3. Place Claimed ✓

Place pin turns gold with a shield icon.
No other tribe can claim it unless it's
released.

Business Rule: A claimed Place cannot be claimed again unless the current owner explicitly releases it.

Flow 1: Onboarding & Discovery

The first 60 seconds that define retention

Day-1 Experience: We never show a global feed. Users immediately see '3 Tribes within 500m of you'.

Flow 2: Joining a Tribe

The moment everything changes for the user

BEFORE Joining

Empty feed — no local content

Map shows grey pins only

No chat access

No territory visible

JOIN TRIBE

AFTER Joining ✓

Feed fills with hyper-local posts

Map renders tribe's claimed territory

Tribe chat room unlocked

Tribe-only events & places visible

Flow 3: Creating a New Place

How users add real-world locations to the map

1

Claim Icon

User Click on claim icon ,Select on Create Place.

2

Fill Details

Enter: Name, Category (Café / Park / Shop), upload 1–3 photos.

3

Assign to Tribe

MUST select one of your joined Tribes. Prevents orphan places & spam.

4

Place Created!

Green pin drops on map. Visible to all Tribe members instantly.

Rule: You CANNOT create a place without belonging to a Tribe. Every place must be 'sponsored' by a community.

Flow 4: Claiming an Existing Place

The power move — how territory is won

Flow 5: Territory Expansion

Why Orbis is unlike anything else — the living strategy map

Tribes don't just CHAT — they GROW by claiming real places. The map becomes a living strategy game.

Flow 6 & 7: Posting Media & Feed System

How content is created and distributed

Posting Flow

Must be at or near a Place (GPS check)

Upload Image or Video

Add caption & optional tags

Post auto-tagged with Place + Tribe

Appears across multiple feed types

Feed Types

Nearby

Posts from Places within 2km of your current GPS.

Tribe

Posts from your joined tribe members at any location.

Public

Top trending posts globally — highest engagement wins.

Flow 8 & 9: Social Interactions & Chat

How communities communicate and engage

Indore Foodies

48 members · 12 online now

@rahul: Just claimed Spice Route Café for us!

@priya: Let's meet there Sunday! Who's in?

Territory: 7 places claimed · Rank #3 in Indore

Comment

Threaded comments on every post.

Share

Share to Tribe, DM, or external link.

Direct Message

1-on-1 messaging between tribe members.

Complete System Flow

The end-to-end chain — memorize this

Why This Chain Matters:

Every action reinforces the map data and community growth

More members → More places claimed → Bigger territory → More visibility → More members (flywheel)

Visual Flow Breakdown

From user action to map render — the technical round-trip

QA Testing Matrix

What to test — and what to watch out for

Feature Area	Test Cases	Risk Level	Edge Cases
Tribe Flow	Join / Exit / Member list visibility	Medium	Concurrent joins, max member limit
Place Flow	Create / Duplicate GPS / Edit details	High	Same café listed 3× at same coords
Claim Flow	Claim / Release / Conflict resolution	High	2 users claiming same place simultaneously
Territory Logic	Polygon boundary drawing, place outside radius	High	Disconnected places — breaks convex hull
Feed System	Nearby vs Tribe vs Global filtering	Medium	Posts in Global but not Nearby
Media Upload	Large video, compression, CDN latency	Low	File >100MB — timeout handling
Sync / Realtime	Web vs Mobile consistency	Medium	Place on web, not visible on mobile 10min

Focus on concurrency: What happens when two users claim the same place at the exact same millisecond?

High-Risk Bug Areas

The 4 places that will cause 80% of your bug reports

01

Duplicate Places

Same café listed 3 times at the same GPS coordinates. Need: Geo-dedup logic with radius threshold ($\leq 10\text{m}$ = same place).

Fix: Merge-on-create check + manual merge UI for admins.

02

Claim Conflicts

Tribe A claims a place. Tribe B's map still shows it as unclaimed for 2 minutes due to cache lag.

Fix: Invalidate cache on claim event + WebSocket push to all active clients.

03

Feed Filtering Errors

Posts appear in Global feed but are missing from Nearby feed despite being posted 500m away.

Fix: Validate GPS bounding box query logic. Test at exact 2km boundary.

04

Sync Delay (Web vs Mobile)

Place created on web app is not visible on mobile client for up to 10 minutes.

Fix: Unified event bus (Kafka/Redis pub-sub) for real-time sync across clients.

Real-Life Use Case: New in City

The killer use case that drives word-of-mouth growth

1

Student Arrives

Moves to Indore for college.
Knows nobody. Doesn't know
the city.

2

Discovers Tribe

Opens Orbis. Sees 'Indore
Gamers' tribe 400m away with
234 members.

3

Joins & Explores

Joins instantly. Map lights up
with 12 claimed places —
cafés, LAN arenas, hangouts.

4

Posts & Connects

Posts from a café, gets 50 likes,
makes 3 real-world friends in
week 1.

Target Users: College students · Digital nomads · Relocated families · Expats — anyone new to a place.

Unique Value Proposition (UVP)

No other app combines all three

A Location-driven social ecosystem where communities GROW by claiming real-world places.

The KT Explanation Script

What to say when someone asks 'What is Orbis?'

Orbis Social App is a location-based community platform where users join geographically defined groups called 'Tribes'. Each Tribe controls a visible territory on the map. Users create or claim real-world places to expand that territory. Like Instagram, users post media from these places and interact with each other. It's the ultimate tool for discovering local culture and building real-world community.

LOCATION

Tribes

Region

Final Summary: The 4 Things to Remember

Walk away with these — everything else is detail

1

Tribe = Territory

A Tribe is a community + a GPS-defined region on the live map. This is the core concept that powers everything.

2

Places = Range

Claiming real-world places expands a Tribe's territory and visibility. It's the primary engagement mechanic.

3

Content = Exploration

Posts fuel three feed types: Nearby, Tribe, and Global. Location-anchored media is what keeps users returning daily.

4

Test = Map + Claims + Feeds

Your holy trinity of bug reports. Automate geo-dedup, concurrency in claims, and feed boundary edge cases first.

Thank You
